Whiteboard photo: cursor encoding

cursor = base64url(created_at + '|' + id)

Example: created_at = 2026-03-04T10:15:22.481Z, id = 9f3a. Joined with a bar and base64url-encoded, this gives MjAyNi0wMy0wNFQxMDoxNToyMi40ODFafDlmM2E.

To decode: base64url-decode the cursor, then split the result on the bar. The first part is the timestamp and the second part is the id. If decoding fails or there are not exactly two parts, return 400.
